Ali Keshtkaran (22187440)

Built the Booking module (FitnessClass, Booking, BookingResult, BookingService) with its unit tests, and the Reporting module (ReportingService) with its unit tests. Set up the Blazor Web project's dependency injection and built the Dashboard, Classes, and Bookings pages. Added the shared GymDataStore, updated the NavMenu to reflect the real pages, removed leftover template pages, added a duplicate-member-ID guard, and wrote the repository README. Drove the app end-to-end as an informal QA pass. Wrote the report's Task 3 (Proposed Solution and Prototype) and Task 6 (Test Cases and Traceability Matrix).

Srikar Kurani (23203952)

Built the Membership module (Membership class with validation, IsActive, Renew, and DaysUntilExpiry) and the Check-in module (CheckIn class), with unit tests for both. Introduced the IClock abstraction and FakeClock test double so expired memberships can be constructed for testing without breaking the constructor guard. Scaffolded the GymManagement.Web Blazor Server project and built the Members page (registration, renewal, and check-in). Wrote the report's Task 5 (Test Strategy) and Task 7 (Progress, Risks and Reflection).

Both members contributed to Task 1 (Problem Definition), Task 2 (Requirements), and Task 4 (AI-Assisted Development). Both members committed directly to master under their own GitHub accounts and averaged more than two meaningful commits per week throughout the project.
